Graduate Visa (2 years). No sponsorship required.

PROFILE

First Class Honours CS graduate (UWL, 78%; 93% Programming, 90% Machine Learning) with hands-on experience building and shipping full-stack and mobile applications. Have built and shipped across React Native, Next.js, FastAPI, and Supabase in both team and solo settings. Looking for a junior or graduate engineering role where I can keep creating, bringing ideas from concept to production and growing alongside a strong team.

SKILLS

Languages: TypeScript, JavaScript, Python, SQL (PostgreSQL), Dart, HTML5

Frameworks and Libraries: React Native, Expo, React, Next.js, FastAPI, Tailwind CSS, Vite

Tools and Platforms: Supabase, Firebase, Jest, Git/GitHub, GitHub Actions, Docker, Vercel, Render, Cloudflare Pages, Railway, DigitalOcean, Caddy, Claude Code

Concepts: REST APIs, OOP, CI/CD, Agile, Performance Monitoring, GenAI API integration

WORK EXPERIENCE

B&A Systems - Web Developer (Freelance) Jan - Mar 2025

Quantitative analytics firm serving UCITS fund managers

- Built a single-page business application from initial mockup to live deployment, working directly with stakeholders to meet technical and branding requirements, achieving a 98+ Lighthouse score.
- Set up deployment via Cloudflare Pages with Git-based CI/CD, cutting manual release steps to zero.
- Wrote technical documentation and handover guides so the client could manage the site independently after delivery.

PROJECTS

MemoryStones: Cross-Platform Performance Study github.com/anugrahnm/memory-stones

Flutter (Dart) · React Native (Expo) · TypeScript · Firebase Performance Monitoring · Dissertation (76%)

- Built the same interactive memory game twice, once in Flutter and once in React Native, using custom in-app diagnostic tooling to measure tap-to-render latency, frame timing, and jank, validated against Firebase Performance Monitoring, Flutter DevTools, and Xcode Instruments.
- Designed and implemented the diagnostic tooling from scratch, including a tap latency recorder and jank frame counter, to capture interaction-level data that Firebase Performance Monitoring alone could not provide.
- Flutter averaged 18.6ms interaction latency vs React Native's 21.4ms in normal gameplay; under heavier load Flutter held at 19.8ms while React Native degraded to 28.8ms. React Native (via Expo) used 3.4x less memory during active gameplay (94 MiB vs 323 MiB).

Villages-Social: Community Social Media App github.com/The-Villagers · May 2025 - Present

React Native · TypeScript · Supabase · PostgreSQL · Jest

- Collaborated in a small startup team to build and ship multiple features end-to-end across a social mobile app, owning the full stack from data models and service layers to UI components and tests.
- Refactored authentication error handling into dedicated service files with network resilience across 3 user flows.
- Fixed two Android-specific bugs: descender clipping on characters like g, y, and p by extending the app's text style system, and keyboard avoiding view pushing whitespace into the tab bar.
- Reviewed and merged 5+ PRs spanning features, bug fixes, and infrastructure.

Data Summarizer: AI Document Tool github.com/anugrahnm/data-summarizer

FastAPI · React · Vite · TypeScript · Google Gemini API · Docker · DigitalOcean

- Built a full-stack AI document summarisation tool with a React/Vite/TypeScript frontend and FastAPI backend, integrating the Google Gemini API.
- Containerised the backend with Docker and self-hosted on a DigitalOcean VPS behind a Caddy reverse proxy with automatic HTTPS.
- Implemented a GitHub Actions CI/CD pipeline to automate deployment on every push to main.
- Replaced a Streamlit prototype with a production React frontend, implementing file upload, markdown rendering, and error handling from scratch.

EDUCATION

University of West London London, UK

BSc (Hons) Computer Science - First Class Honours (78% Overall) | Graduated: February 2026

Notable modules: Programming 93%, Machine Learning 90%
